DESCRIPTION

ASCII is a TSR (Terminate and Stay Resident) character chart. When installed, you can activated it by pressing Ctrl+Alt+A. The program will then display a chart of the 256 ASCII characters and you can see their decimal, hexadecimal and binary values. If you press Enter, the selected character will be placed into the keyboard buffer.

ASCII was designed for programmers to easily be able to lookup character values or to easily convert small numbers to / from hexadecimal or binary. But ASCII can also be very useful for anyone using a DOS editor who wants to be able to insert special characters, without knowing their ASCII values by heart.

ASCII takes only 3 Kb of memory. You can add ASCII to your AUTOEXEC.BAT file so it is loaded each time you start your PC.

LICENSE

This program is FREEWARE! Please see the file LICENSE.TXT for more details.

USAGE

ASCII [Options]

Options:

```
/H or /?     show help information
/R           remove ASCII.COM from memory
/Xnn         X-position of table (1-45)
/Ynn         Y-position of table (1-13)
/O           run once, don't stay resident
/Tnnn        set text color (0-255)
/Fnnn        set frame color (0-255)
```

After starting ASCII.COM and activating it using Ctrl+Alt+A, the following keys are available:

```
arrow keys   move the cursor through the chart
Home         go to the top left (character 0)
End          go to the bottom right (character 255)
PgUp         go to the top line
PgDn         go to the bottom line
Shift        press BOTH Shift keys to view see 256 color combinations
Enter        insert the selected character into the keyboard buffer
             (AT-keyboards only)
Esc          quit, return to the program that was running
other keys   move to the ASCII or scan code of the key you type
```

Mouse buttons

right	select the character at the mouse pointer
